Recent Updates:

v276: Added two new optional parameters (BSLOPE DEFINITION and BSLOPE_VALUE) for the p_T spectrum ('bslope') for proton targets or incoherent production on nuclei

v275: Added γ to axion channel as two-photon channel 88, per S. Knapen et al., arXiv:1607.07083 v273: "Baseline" version, described in arXiv:1607.03838)

Overview:

The STARlight Monte Carlo models 2-photon and photon-Pomeron interactions in ultra-peripheral heavy ion collisions. The physics approach for the photon-Pomeron interactions is described in Klein and Nystrand, Phys. Rev. C60, 014903 (1999), with the p_t spectrum (including vector meson interference) discussed in Phys. Rev. Lett. 84, 2330 (2000). The 2-photon interactions are described in Baltz, Gorbunov, Klein, Nystrand, Phys.Rev. C80 044902 (2009).

STARlight has several input files, all of which are expected to be in the same directory as the starlight code. User-specified input parameters are read from a file named "slight.in"; these parameters are described below in [Input](#).

The simulated events are written to an ASCII file named "slight.out", which is described below in [Output](#).

Installation:

To obtain the latest version:

```
-svn co http://starlight.hepforge.org/svn/trunk
```

Alternatively:

```
-Visit https://starlight.hepforge.org/trac/browser  
-Download the trunk [click on the download symbol in the Size column]  
-Unpackage the zip file. The trunk/ represents <PathToSource>
```

To build Starlight:

```
- First create your build directory <BUILDDIR> (e.g. mkdir bin)  
- $ cd <BUILDDIR>  
- $ cmake <PathToSource>  
- $ make
```

This creates an executable file, starlight, in the build directory.

To clean the build:

```
- $ make clean
```

To run starlight, a configuration file, slight.in, is needed. Examples of slight.in may be found in the config/ directory.

To run:

```
$ ./starlight
```

Enabling Pythia:

To simulate the η , η' , and η_c channels, you need Pythia v8.2 or higher to handle their decays. To enable Pythia support you need to run cmake with the option `-DENABLE_PYTHIA=ON` and have `$PYTHIADIR` pointing to the top directory of Pythia8. [Note: when building Pythia, be sure to enable shared libraries(.so). `./configure --enable-shared` before compiling Pythia.]

```
$ setenv PYTHIADIR /my/local/pythia8
```

```
$ cmake <PathToSource> -DENABLE_PYTHIA=ON
```

Note: v8.2+ is necessary since the Pythia directory structure changed[trunk/cmake_modules/FindPythia8.cmake depends on the structure layout], liblhpdfdummy was removed, and Standalone:allowResDec was removed.

To enable DPMJET, please see the passage on [DPMJET](#)

Input :

The input parameters are listed below with typical values for LHC Pb-Pb running given in parentheses. Optional parameters are denoted with *.

```
baseFileName          # The name of the output files. STARlight will
                      # copy the input slight.in to baseFileName.in, and
                      # produce output files baseFileName.txt and
                      # baseFileName.out. (slight)

BEAM_1_Z = 82         # Charge of beam one projectile. (82)
BEAM_1_A = 208        # Atomic number of beam one projectile. (208)
BEAM_2_Z = 82         # Charge of beam two projectile. (82)
BEAM_2_A = 208        # Atomic number of beam two projectile. (208)
BEAM_1_GAMMA = 1470   # Lorentz boost for beam one projectile(pz>0).
                      # (1470)
BEAM_2_GAMMA = 1470.0 # Lorentz boost for beam two projectile(pz<0).
                      # (1470)

W_MAX = 12.0          # Maximum value for the gamma-gamma center of mass
                      # energy,  $W = 4E_1E_2$ , in GeV. Setting W_MAX = -1
                      # tells STARlight to use the default value specified
                      # in inputParameters.cpp (recommended for single
                      # meson production). For single mesons, the default
                      # W_MAX is the particle mass plus five times the
                      # width. For lepton pairs, the default W_MAX is
                      # given by  $2 \hbar c \sqrt{\frac{Y_1 Y_2}{R_1 R_2}}$ . These are defined in
                      # src/inputParameters.cpp (-1)

W_MIN = -1            #Min value of w. Minimum value for the gamma-gamma
                      # center of mass energy,  $W = 4E_1E_2$ , in GeV. Setting
                      # W_MIN = -1 tells STARlight to use the default
                      # value specified in inputParameters.cpp
                      # (recommended for single meson production). The
                      # default W_MIN is the larger of the kinematic limit
                      # ( e.g.  $2m_\pi$  for  $\rho$  decays) or the particle mass minus
                      # five times the width. (-1)

W_N_BINS = 40         #Bins w maximum and minimum values for w (the
                      # gamma-gamma center of mass energy,  $w = 4E_1E_2$ ), and
                      # the number of w bins in the lookup tables (40)

RAP_MAX = 8.          # Maximum rapidity of produced particle. (8)
RAP_N_BINS = 80       # Number of rapidity bins used in the cross
                      # section calculation (80)

CUT_PT* = 0           # Specifies whether the user chooses to place
                      # restrictions on the transverse momentum of the
                      # decay products. 0= no, 1 = yes. (0)

PT_MIN* = 1.0         # If a transverse momentum cut is applied, this
                      # specifies the minimum value produced, in GeV/c.
                      # (1.0)
```

```

PT_MAX* = 3.0      # If a transverse momentum cut is applied, this
                   # specifies the maximum value produced, in GeV/c.
                   # (3.0)
CUT_ETA* = 0      # Specifies whether the user chooses to place
                   # restrictions on the pseudorapidity of the decay
                   # products. 0= no, 1 = yes. (0)
ETA_MIN* = -10    # If a pseudorapidity cut is applied, this
                   # specifies the minimum value produced. (-10)
ETA_MAX* = 10     # If a pseudorapidity cut is applied, this
                   # specifies the maximum value produced. (10)
PROD_MODE = 2     #PROD_MODE=1: Two-photon interaction.
                   #PROD_MODE=2: Coherent photonuclear vector meson
                   # production assuming narrow resonances. This option
                   # should also be used for exclusive vector meson
                   # production in pp collision. In pA or pp
                   # collisions, this option means that the proton
                   # emits the photon and that the gamma-A interaction
                   # is coherent.
                   #PROD_MODE=3: Coherent photonuclear vector meson
                   # production assuming wide resonances. This option
                   # should in be used for exclusive  $\rho^0$ 
                   # production.
                   #PROD_MODE=4: Incoherent photonuclear vector meson
                   # production. In pA collisions, this option means
                   # that the nucleus emits the photon. Do not use for
                   # pp.
                   #PROD_MODE=5: Photonuclear one photon exchange
                   # uses DPMJET single.
                   #PROD_MODE=6: Photonuclear two photon exchange
                   # (both nuclei excited) uses DPMJET double.
                   #PROD_MODE=7: Photonuclear single pA uses DPMJET
                   # Single, proton mode.
                   #PROD_MODE=8: [not supported/verified] Photonuclear
                   # single pA uses Pythia 6
N_EVENTS = 10     #Number of events produced (1000)
PROD_PID = 443013 # For PROD_MODE 1 through 4, this selects the
                   # channel to be produced, in PDG notation. Currently
                   # supported options are list below. (443013)
RND_SEED = 34533  # Seed for random number generator. (34533)
BREAKUP_MODE = 5  # Specifies the way nuclear break-up is handled.
                   # This option only works for lead or gold. It has no
                   # meaning in proton-proton or proton-nucleus
                   # collisions
                   # 1 = hard sphere nuclei (no hadronic break-up if
                   # impact parameter is greater than the sum of
                   # nuclear radii, no restriction on Coulomb break-
                   # up).
                   # 2 = requires Coulomb break-up of both nuclei, with
                   # no restriction on the number of neutrons emitted
                   # by either nucleus (XnXn).
                   # 3 = requires Coulomb break-up of both nuclei, but
                   # requires that a single neutron is emitted from
                   # each nucleus (1n1n).

```

4 = requires Coulomb break-up of neither nucleus. (0n0n)
5 = requires that there be no hadronic break up, no restriction on Coulomb break-up (This is similar to option 1, but with the actual hadronic interaction probability).
6 = requires Coulomb break up of one or both nuclei, with no restriction on the number of neutrons emitted (XnXn + 0nXn + Xn0n).
7 = requires Coulomb break up of only one nucleus, with no restriction on the number of neutrons emitted (0nXn+ Xn0n).

INTERFERENCE = 0 # Specifies whether interference based on the ambiguity of which nucleus emits the photon is included. The effect of this interference is only visible at very small transverse momentum. 0 = interference off, 1 = interference on. (0)

IF_STRENGTH = 1. # If interference is turned on, specifies the percentage of interference. The range is -1.0 - 1.0.; 1 is the standard value for ion-ion collisions, while -1.0 is expected for proton-antiproton collisions. (1)

INT_PT_MAX = 0.24 # Used only when the interference option above is turned on. This specifies the maximum transverse momentum considered, in GeV/c. (0.24)

INT_PT_N_BINS = 120 # Used only when the interference option above is turned on. This specifies the number of bins in transverse momentum to use. (120)

INT_PT_WIDTH = 0 #Used only when the interference option above is turned on. This specifies the width of bins in transverse momentum to use. (0)

XSEC_METHOD* = 0 #Determines which method is used to calculate the cross-section for $\gamma\gamma$ cross-sections. XSEC_METHOD=0 is faster, but works only for symmetric collisions (i.e. with identical nuclei). XSEC_METHOD=1 always works, but is slower. (0)

BSLOPE_DEFINITION*=0 Used for proton and nucleon (i. e. incoherent nuclear) collisions to set the t-spectrum, $dN/dt=\exp(-bt)$. When BSLOPE_DEFINITION=1, then the slope is determined by BSLOPE_VALUE (below). When BSLOPE_DEFINITION=2, the slope is calculated as a function of γp center of mass energy per the H1 analysis, Eur. Phys. J. C46, 585 (2006):
 $b=4.63/\text{GeV}^2 + 4\alpha\ln(W_{\gamma p}/90 \text{ GeV})$
The default value, BSLOPE_DEFINITION=0 has no effect.
Note that this affects the t-slope only; it does not affect the total cross-section

BSLOPE_VALUE* WHEN BSLOPE_DEFINITION=1, this determines the exponential slope for $dN/dt=\exp(-BSLOPE_VALUE*t)$

The following parameters are used only when interfacing with the PYTHIA and/or DPMJET interfaces:

```

MIN_GAMMA_ENERGY = 6    #Allows the user to set the minimum photon energy
                          (in GeV) in the rest frame of the target nucleus.
                          The default is 6.0 GeV and it should never be set
                          below this value since DPMJET was not designed to
                          handle low energy interactions.
MAX_GAMMA_ENERGY = 600000
                          #Allows the user to set the maximum photon energy
                          (in GeV) in the rest frame of the target nucleus.
                          The default is 600000.0 GeV.
PYTHIA_PARAMS = ""      #Used to supply input parameters to the PYTHIA
                          interface. This takes a string to pass on semi-
                          colon separated parameters to PYTHIA 6. eg:
                          "mstj(1)=0;paru(13)=0.1" (the default is a blank
                          string " ")
PYTHIA_FULL_EVENT_RECORD = 1
                          #Determines whether the full event record from
                          PYTHIA is written to slight.out. true = yes,
                          false = no (false). The additional information
                          added is as follows: daughter production vertex (x
                          [mm], y [mm], z [mm], t [mm/c]), mother1, mother2,
                          daughter1, daughter2, PYTHIA particle status code.
                          PYTHIA 8 Particle Properties page describes in more
                          detail the properties of mother, daughter, and
                          status code designations.

```

Channels of Interest:

2-Photon Channels

Currently supported 2-photon (prod. mode = 1) channel options:

jetset id	particle
221	eta
331	eta-prime
441	eta-c
9010221	f0(975)
225	f2(1270)
115	a2(1320)
335	f2(1525)
33	rho0 pair
11	e+/e- pair
13	mu+/mu- pair
15	tau+/tau- pair
88	axion-like particle (ALP)

Process 88 refers to the single production of a hypothetical axion-like particle (ALP), which decays to a pair of photons. The ALP mass has to be specified by the user through the parameter AXION_MASS. The narrow width approximation is assumed here, with a fixed axion decay constant of $\Lambda=1$ TeV. (See equation (1) of arXiv:1607.06083 for the appropriate

conventions.) The cross section can be then rescaled to arbitrary Λ , as long as the narrow width approximation remains valid.

Pomeron-Photon Channels

Currently supported vector meson (prod. mode = 2/3/4) options:

jetset id	particle
113	rho0
223	omega
333	phi
443011	J/psi --> e+e-
443013	J/Psi --> mu+mu-
444011	Psi(2S) --> e+e-
444013	Psi(2S) --> mu+mu-
553011	Upsilon(1S) --> e+e-
553013	Upsilon(1S) --> mu+mu-
554011	Upsilon(2S) --> e+e-
554013	Upsilon(2S) --> mu+mu-
555011	Upsilon(3S) --> e+e-
555013	Upsilon(3S) --> mu+mu-
913	rho0 + direct pi+pi- (with interference). The direct pi+pi- fraction is from the ZEUS results, EPJ C2 p247 (1998)
999	four-prong final states (rho'-like to pi+pi-pi+pi-)

DPMJET:

Simulation of photonuclear interactions with STARlight is possible through an interface with DPMJet. These interfaces can be enabled through options passed to cmake during the configuration process. [Deprecated: Using Pythia 6 as a substitute for DPMJet]

The gfortran compiler is required to use the photonuclear interfaces.

===== 1. Photonuclear interactions with DPMJet =====

----- 1.1. Obtaining and installing DPMJet -----

The DPMJet package can be obtained by contacting the authors as explained here: <http://sroesler.web.cern.ch/sroesler/dpmjet3.html>

Once you have the code proceed with these steps:

Change the line containing the OPT variable in the DPMJet Makefile:

```
OPT = -c -C -std=legacy -O -O3 -g -fexpensive-optimizations  
-funroll-loops -fno-automatic -fbounds-check -v -fPIC
```

----- 64-bit -----

Make sure that all -m32 options are removed from the Makefile.

Unfortunately, the DPMJet package depends on a floating point exception trap implementation, and only a 32-bit version of that is included in the package, which needs to be replaced. An example implementation can be found here:

<http://www.arsc.edu/arsc/support/news/hpcnews/hpcnews376/>

Under "Fortran Floating Point Traps for Linux" there is a code example. A file based on this, fpe.c, can be found in the external/ directory in STARlight. Move that to your DPMJet directory to replace the original file and run:

```
$ gcc -o fpe.o fpe.c
```

Note: if the above command returns the following error:
*/usr/lib/./lib64/crt1.o: In function `_start':
(.text+0x20): undefined reference to `main'
/tmp/ccs2CQsd.o: In function `enable_exceptions':
fpe.c:(.text+0xe): undefined reference to `feenableexcept'*

collect2: error: ld returned 1 exit status

Try: gcc fpe.c -Wall -g -c

feenableexcept is a gcc extension and gcc may need all of the headers present.

----- End 64-bit -----

Then in the DPMJet directory run:

```
$ make
```

Note: When compiling at RCAS(BNL), needed to change g77 to gfortran, needed to install fluka and setenv FLUPRO /path/to/fluka, and modify phojet before compiling. The changes for phojet is at line 29875, from:

```
PRINT LO,'PHO_DIFSLP:ERROR: this option is not installed !'
```

to:

```
WRITE(LO,'(/1X,A,I2)')  
& 'PHO_DIFSLP:ERROR: this option is not installed  
& !',ISWMDL(13)
```

----- 1.2. Compiling Starlight with DPMJet interface -----

To enable the compilation of the DPMJet interface please follow these steps:

CMake uses an environment variable \$DPMJETDIR to locate the DPMJet object files, so define it.

```
$ export DPMJETDIR=<path to dpmjet>
```

Then create a build directory for STARlight

```
$ mkdir <build-dir>
```

and change into it

```
$ cd <build-dir>
```

Run CMake with the option to enable DPMJet

```
$ cmake <path-to-starlight-source> -DENABLE_DPMJET=ON
```

Then build it

```
$ make
```

Note: When compiling at RCAS(BNL), needed to add the gfortran library to the CMakeLists.txt and left it there.

----- 1.3. Running Starlight with DPMJet interface -----

To run Starlight with the DPMJet interface a couple of files are needed in the directory where you want to run Starlight.

The files needed are:

slight.in (Starlight config file. An example suitable for DPMJet can be found in config/slight.in.dpmjet)
my.input (DPMJet config file. An example can be found in config/my.input)
dpmjet.dat (Can be found in the DPMJet source directory)

In the slight.in file the relevant production modes (PROD_MODE) for DPMJET is:

5: A+A single excitation
6: A+A double excitation
7: p+A single excitation

In addition the minimum and maximum gamma energies must be set. These must be within the interval set in the my.input file.

To run:

```
$ ./starlight < my.input
```

```
[DPMJET reads from direct input/interactive]
```

Output

STARlight outputs an ASCII file named slight.out.

For each event, a summary line is printed, with the format

EVENT: n ntracks nvertices ,

where n is the event number (starting with 1), ntracks is the number of tracks in the event, and nvertices is the number of vertices in the event (STARlight does not currently produce events with more than one vertex).

EVENT line is followed by a description of the vertex, with the format

VERTEX: x y z t nv nproc nparent ndaughters ,

where x , y , z and t are the 4-vector components of the vertex location, nv is the vertex number, $nproc$ is a number intended to represent physical process (always set to 0), $nparent$ is the track number of parent track (0 for primary vertex) and $ndaughters$ is the number of daughter tracks from this vertex.

This is followed by a series of lines describing each of the daughter tracks emanating from this vertex. Each track line has the format

TRACK: GPID px py pz nev ntr stopv PDGPID ,

where GPID is the Geant particle id code, px , py and pz are the three vector components of the track's momentum, nev is the event number, ntr is the number of this track within the vertex (starting with 0), $stopv$ is the vertex number where track ends (0 if track does not terminate within the event), and PDGPID is the Monte Carlo particle ID code endorsed by the Particle Data Group.

File Descriptions

Readme.pdf

[This file.] provides information on the installation, operation, and construction of STARlight.

CMakeLists.txt

controls STARlight compilation. For details, please see above in [Installation](#). This is the default/supported compilation method.

Makefile

A sample Makefile for compilation on *nix systems. This file is not actively supported. Please use CMake.

starlightconfig.h.in

passes on some compiler settings; such as enabling the Pythia/DPMJet sections within the source code.

starlightDoxyfile.conf

Doxygen configuration file.

CMake Modules:

FindPythia8.cmake

used by CMake to find the Pythia 8 files needed to compile STARlight with Pythia 8 dependent options enabled. It searches for: Pythia.h, Index.xml, libpythia8

FindPythia6.cmake

used by CMake to find the Pythia 6 files needed to compile STARlight with Pythia 6 dependent options enabled. It searches for: libPythia6. *Pythia 6 functionality has been deprecated.*

FindDPMJet.cmake

used by CMake to find the DPMJET files needed to compile STARlight with DPMJET dependent options enabled. It searches for: dpmjet3.0-5.0, pythia6115dpm3v1.0, and phojet1.12-35c4.0

FindROOT.cmake

used by CMake to find the ROOT files needed to compile STARlight with ROOT dependent options enabled. It searches for: root-config. root-config is then used to set the rest of the paths/options needed to enable ROOT within STARlight.

CommonMacros.cmake

A collection of useful cmake macros.

FindLHAPDF.cmake

used by CMake to find the LHAPDF dependent options enabled. This was necessary for older versions of Pythia8, but this is no longer the case. However, this file is being kept in the

distribution for users that would like to re-enable it. It searches for: Pythia.h and liblhpdfdummy

Config files:

my.input

A sample DPMJET configuration file.

slight.in

A sample STARlight input file, to select the desired final state and associated options. The section [Input](#) has more information.

slight.in.dpmjet

A sample slight.in file to use the DPMJET options (eg: PROD_MODE = 5, 6, 7, and MIN_GAMMA_ENERGY, and MAX_GAMMA_ENERGY).

slight.in.ee_rhic

A sample slight.in file for e+e- production by Au-Au at top RHIC energies

slight.in.jpsi_lhc

A sample slight.in file for J/ψ production by Pb-Pb at the LHC.

slight.in.pPb_lhc

A sample slight.in file for J/ψ production by p-Pb at the LHC.

slight.in.rho_rhic

A sample slight.in file for ρ production by Au-Au at top RHIC energies.

dpmjet:

dpmjetint.f

This is a DPMJET library, used in the CMakeLists.txt file to link when enabling DPMJET.

external:

fpe.c

corrects for the floating point trap differences between 32 and 64-bit. The [DPMJET section](#) has more information.

pythia6:

pythiainterface.h

interfaces Pythia6 with STARlight. *Pythia 6 functionality has been deprecated.*

utils:

Ana.C

This macro runs Analyze.cxx, which takes as input an ASCII STARlight output file, slight.out, and creates a standard set of histograms, which are stored in histograms.root

Analyze.cxx

This macro reads in a starlight output file and creates histograms of the p_T and rapidity of the daughters, as well as the p_T, rapidity and mass of the parent. It assumes there are only 2 daughter tracks that are electrons, muons, or pions. The histograms for the daughter particles are called fPt2, fPt2, fRap1, and fRap2. Parent histograms are created for each possible daughter species (e.g., parent p_T histograms are created with the names fPtEl, fPtMu, and fPtPi), but only the ones corresponding to the actual daughter particle are filled. The histograms are saved in a file called histograms.root.

To use this Analyze.cxx, modify the file Ana.C to call your input file (as downloaded, it calls slight.out) and the number of events you wish to process (as downloaded, it processes 20 events). Then open root and type ".x Ana.C" .

Analyze.h

The header file for Analyze.cxx and Ana.C.

AnalyzeTree.cxx

This macro reads the starlight.root file produced by ConvertStarlightAsciiToTree.C, which contains TLorentzVectors for the parents and a TClonesArray of TLorentzVectors for the daughters. It creates histograms of the p_T and rapidity of the daughters, as well as the p_T, rapidity and mass of the parent. While the parents may have been created as the vector sum of any number of daughter particles, this macro currently produces histograms for only the first two daughter particles. The daughter histograms are called D1Pt, D2Pt, D1Rapidity, and D1Rapidity. Parent histograms are named ParentPt, ParentRapidity, and ParentMass. The histograms are stored in starlight_histos.root.

To use Analyzetree.cxx, first run ConvertStarlightAsciiToTree.C to produce the starlight.root file. If needed, modify the file AnalyzeTree.h to call your input file (as downloaded, it calls starlight.root). Then open root and type .x AnaTree.C .

AnalyzeTree.h

The header file for AnalyzeTree.cxx.

AnaTree.C

compiles and runs AnalyzeTree.cxx, which takes as input the starlight.root file produced by ConvertStarlightAsciiToTree.cxx output histograms are stored in starlight_histos.root

ConvertStarlightAsciiToTree.C

reads a starlight output file (default name slight.out) and creates a root file with TLorentzVectors for the parent and a TClonesArray of TLorentzVectors for the daughter particles. The output is stored in a root file (default name starlight.root) with one branch labeled "parent" and the other labeled "daughters". Any number of daughter tracks can be accommodated. Daughter species currently accommodated are: electrons, muons, charged or neutral pions, charged or neutral kaons, and protons.

To use AnaTree.C, open root and then type `.x ConvertStarlightAsciiToTree.C("inputfilename", "outputfilename")` The root file produced can be examined in a root TBrowser.

A macro to read this root file and make some standard plots is also provided. This macro is called AnalyzeTree.cxx; it can be compiled and run with the AnaTree.C macro by opening root and typing `.x AnaTree.C()`

Source Files:

beam.cpp

generates the beam class, which inherits from the nucleus class (cf. [nucleus.cpp](#)). The object represents an accelerated nucleus, or a beam.

Functions:

```
beam::beam
beam::~~beam
beam::photonFlux // calculates the "photon density" given
                  the impact parameter and energy.
```

beambeamssystem.cpp

represents the colliding system of interest.

Functions:

```
beamBeamSystem::beamBeamSystem
beamBeamSystem::~~beamBeamSystem
beamBeamSystem::probabilityOfBreakup
beamBeamSystem::generateBreakupProbabilities
beamBeamSystem::probabilityOfHadronBreakup
beamBeamSystem::probabilityOfPhotonBreakup
```

bessel.cpp

calculate modified Bessel functions of the first and second kind.

Functions:

```
bessel::besI0
bessel::dbesk0
bessel::dbesk1
bessel::besI1
```

eventchannel.cpp
 inherits from readLuminosity. It is a base for class for functions to produce events that is overloaded by other classes (Gammagammaleptonpair, Gammagammasingle, Gammaavectormeson, starlightDpmJet, and starlightPythia).
Functions:
 eventChannel::eventChannel
 eventChannel::~~eventChannel
 eventChannel::transform // Lorentz Tranforms the frame
 eventChannel::pseudoRapidity // calculates the pseudorapidity with the input from px, py, and pz

eventfilewriter.cpp
 writes event information in the output file.
Functions:
 eventFileWriter::eventFileWriter
 eventFileWriter::~~eventFileWriter
 eventFileWriter::writeEvent

filewriter.cpp
 The base class for eventFileWriter, which is writes event information in the output file.
Functions:
 fileWriter::fileWriter()
 fileWriter::~~fileWriter()
 fileWriter::open
 fileWriter::open(filename)
 fileWriter::close

gammaaluminosity.cpp
 contains the photonNucleusLuminosity class, which inherits from photonNucleusCrossSection. It calculates the differential cross-section for gamma-A interactions.
Functions:
 photonNucleusLuminosity::photonNucleusLuminosity
 photonNucleusLuminosity::~~photonNucleusLuminosity
 photonNucleusLuminosity::photonNucleusDifferentialLuminosity //Calculates and outputs the differential luminosity
 photonNucleusLuminosity::pttablegen // Calculates the pt spectra for VM production with interference per S. Klein and J. Nystrand, Phys. Rev Lett. 84, 2330 (2000).
 photonNucleusLuminosity::vmsigmapt //calculates th effect of the nuclear form factor on the pt spectrum, for use in interference calculations. It calculates the cross section suppression SIGMAPT(PT) as a function of pt. The input pt values come from ptable.inc
 photonNucleusLuminosity::nofe //calculates the 'photon density' d^2N_{γ}/db^2

gammaavm.cpp
 is responsible for classes Gammaavectormesion, Gammaanarrowvm, and Gammaawidevm. Both Gammaanarrowvm and Gammaawidevm inherit from Gammaavectormeson, which inherits from eventChannel. The classes are responsible for

generating and decaying the vector mesons produced by photon-nucleus interactions.

Functions:

```
Gammaavectormeson::Gammaavectormeson
Gammaavectormeson::~Gammaavectormeson
Gammaavectormeson::pickwy //responsible for selecting the
events center of mass energy and rapidity
Gammaavectormeson::twoBodyDecay // This routine decays a
particle into two particles of mass mdec, taking spin into
account
Gammaavectormeson::fourBodyDecay // decays a particle into
four particles with isotropic angular distribution
Gammaavectormeson::getDaughterMass //returns the daughter
particles mass, & the final particles id...
Gammaavectormeson::getTheta //This depends on the decay
angular distribution
Gammaavectormeson::getWidth
Gammaavectormeson::getMass
Gammaavectormeson::getSpin //it's a VM, returns 1
Gammaavectormeson::momenta // calculates momentum and
energy of vector meson given W and Y, without
interference.
Gammaavectormeson::pTgamma //finds the photon pT
Gammaavectormeson::vmpt // calculates momentum and energy
of a vector meson given W and Y, including interference.
It gets the pt distribution from a lookup table.
produceEvent
pseudorapidity
Gammaanarrowvm::Gammaanarrowvm
Gammaanarrowvm::~Gammaanarrowvm
Gammaanarrowvm::gammaaincoherentvm
Gammaawidevm::Gammaawidevm
Gammaawidevm::~Gammaawidevm
```

`gammagammaleptonpair.cpp`

inherits from `eventChannel`. It calculates the lepton pair's cross-section and generates and decays the lepton pairs.

Functions:

```
Gammagammaleptonpair::Gammagammaleptonpair
Gammagammaleptonpair::~Gammagammaleptonpair
Gammagammaleptonpair::twoLeptonCrossSection // calculates
section for 2-particle decay, per, see STAR Note 243, Eq.
9. It calculates the 2-lepton differential cross section
Gammagammaleptonpair::twoMuonCrossSection // gives the
two muon cross section as a function of Y&W, per G.Soff
et. al Nuclear Equation of State, part B, 579
Gammagammaleptonpair::pickw // Picks a w for the 2- photon
calculation.
Gammagammaleptonpair::picky // Picks a y given a W
Gammagammaleptonpair::pairMomentum // calculates
px,py,pz,and E given w and y
Gammagammaleptonpair::pp_1 // For beam 1, returns a
random momentum drawn from from pp_1(E) distribution
Gammagammaleptonpair::pp_2 // For beam 2, returns a
random momentum drawn from from pp_2(E) distribution
```

```

Gammagammaleptonpair::twoBodyDecay //decays a particle
into two particles of mass mdec, taking spin into account
Gammagammaleptonpair::thetalep // calculates the cross-
section as a function of angle for a given W and Y, for
the production of two muons or taus, per Brodsky et al.
PRD 1971, 1532 equation 5.7
Gammagammaleptonpair::produceEvent //returns the vector
with the decay particles inside
Gammagammaleptonpair::calculateTable //calculates the
tables that are used elsewhere in the Monte Carlo the tau
decay follows V-A theory,  $1 - 1/3 \cos(\theta)$  the energy of
each of the two leptons in tau decay is calculated using
formula 10.35 in "Introduction to elementary particles by
D. Griffiths," which assumes that the mass of the electron
is 0. The maximum electron energy in in such a system is
 $0.5 * \text{mass of the tau}$ 
Gammagammaleptonpair::tauDecay // assumes that the
tauons decay to electrons and calculates the directons of
the decays
Gammagammaleptonpair::getMass
Gammagammaleptonpair::getWidth
Gammagammaleptonpair::getSpin

```

gammagammaingle.cpp

inherits from eventChannel. It calculates the cross-section for single mesons and generates and decays the single mesons from gamma-gamma interactions. It also generates single mesons which are then decayed by Pythia 8.

Functions:

```

Gammagammaingle::Gammagammaingle
Gammagammaingle::~Gammagammaingle
Gammagammaingle::singleCrossSection // calculates the
cross-section in the narrow-width approximation, per STAR
Note 243, Eq. 8
Gammagammaingle::pickw // picks a w for the 2-photon
calculation.
Gammagammaingle::picky
Gammagammaingle::parentMomentum // calculates
px,py,pz,and E given w and y
Gammagammaingle::pp_1 // For beam 1, returns a random
momentum drawn from from pp(E) distribution
Gammagammaingle::pp_2 // For beam 2, returns a random
momentum drawn from from pp(E) distribution
Gammagammaingle::twoBodyDecay //decays a particle into
two particles of mass mdec, taking spin into account
Gammagammaingle::produceEvent
Gammagammaingle::getMass
Gammagammaingle::getSpin

```

incoherentPhotonNucleusLuminosity.cpp

is responsible for the incoherentPhotonNucleusLuminosity class and inherits from photonNucleusCrossSection. It houses the differential luminosity calculation for incoherent gamma-A interactions.

Functions:

```

incoherentPhotonNucleusLuminosity::incoherentPhotonNucleus
Luminosity
incoherentPhotonNucleusLuminosity::~~incoherentPhotonNucleu
sLuminosity
incoherentPhotonNucleusLuminosity::incoherentPhotonNucleus
DifferentialLuminosity
incoherentPhotonNucleusLuminosity::nofe //Function for the
calculation of the "photon density".

```

incoherentVMCrossSection.cpp

inherits from photonNucleusCrossSection. It calculates the cross-section for incoherent photon-nucleus interactions.

Functions:

```

incoherentVMCrossSection::incoherentVMCrossSection
incoherentVMCrossSection::~~incoherentVMCrossSection
incoherentVMCrossSection::crossSectionCalculation //
calculates the vector meson cross section assuming a
narrow resonance. For reference, see STAR Note 386.

```

inputParameters.cpp

sets and stores STARlight's input parameters.

Functions:

```

inputParameters::inputParameters
inputParameters::~~inputParameters
inputParameters::init
inputParameters::configureFromFile
inputParameters::print
inputParameters::write
inputParameters::parameterValueKey

```

inputParser.cpp

parses the input files and stores the information in the inputParameters.

Functions:

```

inputParser::inputParser()
inputParser::~~inputParser()
inputParser::parseFile
inputParser::parseString
inputParser::addIntParameter
inputParser::addUIntParameter
inputParser::addFloatParameter
inputParser::addDoubleParameter
inputParser::addBoolParameter
inputParser::addStringParameter
inputParser::printParameterInfo
inputParser::validateParameters

```

lorentzvector.cpp

holds Lorentz 4-vectors.

Functions:

```

lorentzVector::lorentzVector
lorentzVector::~~lorentzVector
SetXYZT

```

main.cpp

the "main" file/function—where the program starts.

narrowResonanceCrossSection.cpp

inherits from photonNucleusCrossSection. It calculates the cross-section for narrow resonance vector mesons.

Functions:

```
narrowResonanceCrossSection::narrowResonanceCrossSection
narrowResonanceCrossSection::~narrowResonanceCrossSection
narrowResonanceCrossSection::crossSectionCalculation //
calculates the vector meson cross section assuming a
narrow resonance, per STAR Note 386.
```

nBodyPhaseSpaceGen.cpp

is responsible for the kinematics used in the four-prong decays.

Functions:

```
nBodyPhaseSpaceGen::nBodyPhaseSpaceGen
nBodyPhaseSpaceGen::~nBodyPhaseSpaceGen
nBodyPhaseSpaceGen::setDecay // sets decay constants and
prepares internal variables
nBodyPhaseSpaceGen::generateDecay// generates event with
certain n-body mass and momentum and returns event weight
general purpose function
nBodyPhaseSpaceGen::generateDecayAccepted// generates full
event with certain n-body mass and momentum only, when
event is accepted (return value = true) this function is
more efficient, if only weighted evens are needed
nBodyPhaseSpaceGen::pickMasses// randomly choses the (n -
2) effective masses of the respective (i + 1)-body systems
nBodyPhaseSpaceGen::calcWeight// computes event weight (=
integrand value) and breakup momenta uses vector of
intermediate two-body masses prepared by pickMasses()
nBodyPhaseSpaceGen::calcEventKinematics// calculates
complete event from the effective masses of the (i + 1)-
body systems, the Lorentz vector of the decaying system,
and the decay angles uses the break-up momenta calculated
by calcWeight()
nBodyPhaseSpaceGen::estimateMaxWeight// calculates maximum
weight for given n-body mass
nBodyPhaseSpaceGen::print
```

nucleus.cpp

defines the basis properties of a nucleus such as radius, form factor, and thickness.

Functions:

```
nucleus::nucleus
nucleus::~nucleus
nucleus::init
nucleus::nuclearRadius
nucleus::formFactor
nucleus::dipoleFormFactor
nucleus::thickness// calculates the nuclear thickness
function per Eq. 4 in Klein and Nystrand, PRC 60
```

photonNucleusCrossSection.cpp

calculates the cross-section for coherent photon-Nucleus interactions.

Functions:

```

photonNucleusCrossSection::photonNucleusCrossSection
photonNucleusCrossSection::~~photonNucleusCrossSection
photonNucleusCrossSection::getcsgA // returns the cross-
section for photon-nucleus interaction producing vector
mesons
photonNucleusCrossSection::photonFlux // gives the
photon flux as a function of energy Egamma for arbitrary
nuclei and gamma. The first time it is called, it
calculates a lookup table which is used on subsequent
calls. It returns dN_gamma/dE (dimensions 1/E), not dI/dE
energies are in GeV, in the lab frame
photonNucleusCrossSection::nepoint// gives the spectrum of
virtual photons, dn/dEgamma, for a point charge q=Ze
sweeping past the origin with velocity gamma, integrated
over impact parameter from bmin to infinity, per Eq. 15.54
of Jacksons Classical Electrodynamics
photonNucleusCrossSection::sigmagp// gives the gamma-
proton --> VectorMeson cross section. Wgp is the gamma-
proton CM energy. Unit for cross section: fm**2
photonNucleusCrossSection::sigma_A// Nuclear Cross Section
sig_N,sigma_A in (fm**2)
photonNucleusCrossSection::sigma_N// Nucleon Cross Section
in (fm**2)
photonNucleusCrossSection::breitWigner// uses simple
fixed-width s-wave Breit-Wigner without coherent
background for rho' (PDG '08 eq. 38.56)

```

pythiadecayer.cpp

links Pythia 8 and STARlight, and initializes Pythia 8.

Functions:

```

pythiaDecayer::pythiaDecayer
pythiaDecayer::~~pythiaDecayer
pythiaDecayer::init
pythiaDecayer::addParticle
pythiaDecayer::execute

```

randomgenerator.cpp

STARlight's random number generator, using the same algorithm as ROOTs TRANDOM3 class. It is based on M. Matsumoto and T. Nishimura, Mersenne Twistor: A 623-dimensionally equidistributed uniform pseudorandom number generator. For more information see <http://www.math.keio.ac.jp/~matumoto/emt.html>

Functions:

```

randomGenerator::SetSeed
randomGenerator::Rndom

```

readinluminosity.cpp

reads in the luminosity tables from slight.txt, which is generated in the early stages of the program.

Functions:

```

readLuminosity::readLuminosity
readLuminosity::~~readLuminosity
readLuminosity::read

```

spectrum.cpp
 sets up functions needed to make cross-section calculations for general photonuclear interactions modeled with DPMJET.
Functions:
 spectrum::spectrum
 spectrum::generateKsingle
 spectrum::generateKdouble
 spectrum::drawKsingle
 spectrum::drawKdouble
 spectrum::generateBreakupProbabilities
 spectrum::getFnSingle
 spectrum::getFnDouble
 spectrum::getTransformedNofe

spectrumprotonnucleus.cpp
 sets up functions needed to make cross-section calculations for general photonuclear interactions modeled with DPMJET.
Functions:
 spectrumProtonNucleus::spectrumProtonNucleus
 spectrumProtonNucleus::generateBreakupProbabilities
 spectrumProtonNucleus::getSigma

starlight.cpp
 initializes and then produces and decays events.
Functions:
 starlight::starlight
 starlight::~~starlight
 starlight::init
 starlight::produceEvent
 starlight::luminosityTableIsValid
 starlight::createEventChannel

starlightdpmjet.cpp
 hosts the class starlightDpmJet which inherits from the eventChannel class. It includes methods to generate diffractive events with DPMJET.
Functions:
 starlightDpmJet::starlightDpmJet
 starlightDpmJet::init
 starlightDpmJet::produceEvent
 starlightDpmJet::produceSingleEvent
 starlightDpmJet::produceDoubleEvent

starlightparticle.cpp
 is a container to store particle information.
Functions:
 starlightParticle::starlightParticle
 starlightParticle::~~starlightParticle

starlightparticlecodes.cpp
 converts jetset particle numbers to the corresponding GEANT code.
Functions:
 starlightParticleCodes::jetsetToGeant

starlightpythia.cpp

inherits from the eventChannel class. It includes methods to calculate diffractive events with Pythia6. *Pythia 6 functionality has been deprecated.*

Functions:

starlightPythia::starlightPythia
starlightPythia::~~starlightPythia
starlightPythia::init
starlightPythia::produceEvent

starlightStandalone.cpp

is used by Main.cpp and in turn calls methods from the starlight class.

Functions:

starlightStandalone::starlightStandalone
starlightStandalone::~~starlightStandalone
starlightStandalone::init
starlightStandalone::run
starlightStandalone::boostEvent

twophotonluminosity.cpp

inherits from beamBeamSystem, and is responsible for calculating the two photon luminosity table based on W and Y.

Functions:

twoPhotonLuminosity::twoPhotonLuminosity
twoPhotonLuminosity::~~twoPhotonLuminosity
twoPhotonDifferentialLuminosity
twoPhotonLuminosity::D2LDMDY
twoPhotonLuminosity::D2LDMDY_Threated
twoPhotonLuminosity::integral
twoPhotonLuminosity::radmul
twoPhotonLuminosity::integrand
twoPhotonLuminosity::Nphoton

upcevent.cpp

stores the final event information.

Functions:

upcEvent::upcEvent
upcEvent::operator=
upcEvent::operator+
upcEvent::boost

vector3.cpp

is a container for 3D-vectors.

Functions:

vector3::vector3
vector3::~~vector3
vector3::SetVector

wideResonanceCrossSection.cpp

inherits from photnNucleusCrossSection. It is responsible for calculating the cross-section of vector mesons with a wide resonance (eg. Rho).

Functions:

wideResonanceCrossSection::wideResonanceCrossSection

```
wideResonanceCrossSection::~wideResonanceCrossSection
wideResonanceCrossSection::crossSectionCalculation //
calculates the cross-section assuming a wide(Breit-Wigner)
resonance.
```

Include Files:

```

Functions

photonNucleusCrossSection
~photonNucleusCrossSection
slopeParameter///
returns slope of t-distribution
[(GeV/c)⁻²]
getChannelMass ///
returns mass of the produced
system [GeV/c²]
getBNORM
luminosity///
returns luminosity [10²⁶ cm⁻²
sec⁻¹]
getbbs///
returns beamBeamSystem
vmPhotonCoupling ///
vectormeson-photon coupling
constant f_v / 4 pi (cf. Eq. 10 in KN PRC 60 (1999)
014903)
getDefaultC
maxPhotonEnergy///
returns max photon energy in lab
frame [GeV] (for vectormesons only)
crossSectionCalculation
